Allowable Subject Matter

1. Claims 1-3 are allowed.

Independent claim 1 recites a deblocking filter apparatus that includes "...the cycles of the arithmetic processing performed on each combination of arithmetic blocks up to the conclusion of the filter processing should be the same, among combination of a first and a second arithmetic block, a combination of a third and a fourth arithmetic block, a combination of a fifth and a sixth arithmetic block, and a combination of a seventh and a eighth arithmetic block, respectively so that the filter processing of each combination of arithmetic blocks is concluded successively among the respective combinations, and which said control circuit also for controlling said output selection circuit to select output from the arithmetic blocks for each combination of the arithmetic blocks and to perform a pipeline output..." which is a feature that is not anticipated nor obvious over the art of record. Independent claim 3 recites a deblocking filtering method that includes a step of having "...the cycles of the arithmetic processing performed on each combination of arithmetic blocks up to the conclusion of the filter processing should be the same, among combination of a first and a second arithmetic block, a combination of a third and a fourth arithmetic block, a combination of a fifth and a sixth arithmetic block, and a combination of a seventh and a eighth arithmetic block, respectively so that the filter processing of each combination of arithmetic blocks is concluded successively among the respective combinations, and which said control circuit also for controlling said output selection circuit to select output from the arithmetic blocks for each combination of the arithmetic blocks and to perform a pipeline output successively; and performing a pipeline output of pixel data which are obtained by said receiving and subjected to the filter processing, for the respective
